ABSTRACT

866 15-4

A computer-implemented interface method for use with a display device associated with an exercise device includes connecting a network connection to the exercise device capable of accessing information stored over a network, partitioning a first portion of the display device associated with the exercise device to display content, partitioning a second portion of the display device associated with the exercise device to display one or more controls that control the exercise device, and providing a selectable element on the display device that upon selection removes the second portion of the display used to display the one or more controls.
